

Algebra	Definition/Tips	Example
1. Expression	A mathematical statement written using symbols, numbers or letters,	$3x + 2$ or $5y^2$
2. Equation	A statement showing that two expressions are equal	$2y - 17 = 15$
3. Identity	An equation that is true for all values of the variables An identity uses the symbol: \equiv	$2x \equiv x+x$
4. Formula	Shows the relationship between two or more variables	Area of a rectangle = length x width or $A = L \times W$
5. Simplifying Expressions	Collect 'like terms'. Be careful with negatives. x^2 and x are not like terms.	$2x + 3y + 4x - 5y + 3$ $= 6x - 2y + 3$ $3x + 4 - x^2 + 2x - 1$ $= 5x - x^2 + 3$
6. x times x	The answer is x^2 not $2x$.	Squaring is multiplying by itself, not by 2.
7. $p \times p \times p$	The answer is p^3 not $3p$	If $p=2$, then $p^3=2 \times 2 \times 2=8$, not $2 \times 3=6$
8. $p + p + p$	The answer is $3p$ not p^3	If $p=2$, then $2+2+2=6$, not $2^3 = 8$
9. Expand	To expand a bracket, multiply each term in the bracket by the expression outside the bracket.	$3(m + 7) = 3m + 21$
10. Factorise	The reverse of expanding. Factorising is writing an expression as a product of terms by 'taking out' a common factor.	$6x - 15 = 3(2x - 5)$, where 3 is the common factor.

Perimeter/ Area	Definition/Tips	Example
1. Perimeter	The total distance around the outside of a shape. Units include: mm, cm, m etc.	<p style="text-align: right;">8 cm</p>  <p style="text-align: left;">5 cm</p> <p style="text-align: right;">$P = 8 + 5 + 8 + 5 = 26cm$</p>
2. Area	The amount of space inside a shape. Units include: mm^2, cm^2, m^2	 <p style="text-align: right;">9 cm</p>
3. Area of a Rectangle	Length x Width	 <p style="text-align: left;">4 cm</p> <p style="text-align: right;">$A = 36cm^2$</p>
4. Area of a Parallelogram	Base x Perpendicular Height Not the slant height.	 <p style="text-align: right;">$A = 21cm^2$</p>
5. Area of a Triangle	Base x Height $\div 2$	 <p style="text-align: right;">$A = 24cm^2$</p>

Multiplication Index Law	When multiplying with the same base (number or letter), add the powers . $a^m \times a^n = a^{m+n}$	$7^5 \times 7^3 = 7^8$ $a^{12} \times a = a^{13}$ $4x^5 \times 2x^8 = 8x^{13}$
Division Index Law	When dividing with the same base (number or letter), subtract the powers . $a^m \div a^n = a^{m-n}$	$15^7 \div 15^4 = 15^3$ $x^9 \div x^2 = x^7$ $20a^{11} \div 5a^3 = 4a^8$
Brackets Index Laws	When raising a power to another power, multiply the powers together. $(a^m)^n = a^{mn}$	$(y^2)^5 = y^{10}$ $(6^3)^4 = 6^{12}$ $(5x^6)^3 = 125x^{18}$
Notable Powers	$p = p^1$ $p^0 = 1$	$99999^0 = 1$

Fraction

A mathematical expression representing the division of one integer by another. Fractions are written as two numbers separated by a horizontal line.

YEAR 8 MATHS KNOWLEDGE ORGANISER

Linear Sequence: A number pattern with a **common difference**.

2, 5, 8, 11... is a linear sequence

Term: Each value in a sequence is called a term. In the sequence 2, 5, 8, 11..., 8 is the third term of the sequence.

Term-to-term rule: A rule which allows you to **find the next term** in a sequence if you **know the previous term**.

First term is 2. Term-to-term rule is 'add 3'

Sequence is: 2, 5, 8, 11...

nth term: A rule which allows you to **calculate the term** that is in the **nth position** of the sequence.

Also known as the 'position-to-term' rule.

n refers to the **position** of a term in a sequence.

nth term is $3n - 1$

The 100th term is $3 \times 100 - 1 = 299$

Finding the nth term of a linear sequence:

1. Find the **difference**.
2. **Multiply that by n**.
3. Substitute $n = 1$ to **find out what number you need to add or subtract to get the first number in the sequence**.

Find the nth term of: 3, 7, 11, 15...

1. Difference is +4
2. Start with $4n$
3. $4 \times 1 = 4$, so we need to subtract 1 to get 3.
nth term = $4n - 1$

Rounding: To make a number simpler but keep its value close to what it was.

If the **digit to the right** of the rounding digit is **less than 5**, **round down**.

If the **digit to the right** of the rounding digit is **5 or more**, **round up**.

74 rounded to the nearest ten is 70, because 74 is closer to 70 than 80.

152,879 rounded to the nearest thousand is 153,000.

Decimal Place: The position of a digit to the right of a decimal point.

In the number 0.372, the 7 is in the second decimal place.

0.372 rounded to two decimal places is 0.37, because the 2 tells us to round down.

Careful with money - don't write £27.4, instead write £27.40

Significant Figure: The significant figures of a number are the digits which **carry meaning** (ie. are significant) to the size of the number.

The **first significant figure** of a number **cannot be zero**.

In a number with a decimal, trailing zeros are not significant.

In the number 0.00821, the first significant figure is the 8.

In the number 2.740, the 0 is not a significant figure.

0.00821 rounded to 2 significant figures is 0.0082.

19357 rounded to 3 significant figures is 19400. We need to include the two zeros at the end to keep the digits in the same place value columns.

BIDMAS

An acronym for the **order** you should do calculations in.

BIDMAS stands for '**Brackets, Indices, Division, Multiplication, Addition and Subtraction**'.

Indices are also known as 'powers' or 'orders'.

$$6 + 3 \times 5 = 21, \text{ not } 45$$

$$5^2 = 25, \text{ where the 2 is the index/power}$$

$$12 \div 4 \div 2 = 1.5, \text{ not } 6$$

Integer

A **whole number** that can be positive, negative or zero.

$$-3, 0, 92$$

Decimal

A number with a **decimal point** in it. Can be positive or negative.

$$3.7, 0.94, -24.07$$

Negative Number

A number that is **less than zero**. Can be decimals.

$$-8, -2.5$$
